This Provisional Map is equivalent to a standard map in accuracy of content.

Some names on this map are not yet official. Corrections or additions are invited by the Surveys and Mapping Branch.

CONTOUR INTERVAL 25 FEET
Elevations in feet above Mean Sea Level
North American Datum 1927
Transverse Mercator Projection

Cette carte provisoire équivaut une carte régulière au point de vue précision de l'information.

Certains noms inscrits sur cette carte ne sont pas encore officiels. La Direction des levés et de la cartographie saurait gré au public de lui signaler corrections et additions.

EQUIDISTANCE DES COURBES 25 PIEDS
Élévations en pieds au-dessus du niveau moyen de la mer
Système de référence géodésique nord-américain, 1927
Projection transverse de Mercator

Établie par la DIRECTION DES LEVÉS ET DE LA CARTOGRAPHIE, MINISTÈRE DE L'ÉNERGIE, DES MINES ET DES RESSOURCES. Mise à jour d'après des photographies aériennes prises en 1970. Vérifiées des ouvrages en 1973. Imprimée en 1975.

Ces cartes sont en vente au Bureau des Cartes du Canada, ministère de l'Énergie, des Mines et des Ressources, Ottawa, ou chez le vendeur le plus près.

GENERAL COMMENTS

DEPOSIT CHARACTERISTICS

Deposit Number	Material Description	Reserves (1000 m³) Gravel	Reserves (1000 m³) Sand	Additional Comments	Texture (%) Gravel	Texture (%) Sand	Texture (%) Fines	(%) Wear	Overburden Thickness (m)	Deposit Thickness (m)	Deposit Area (ha)	Deposit Genesis	Additional Comments
1	Clean sand	161	756	Delineation is approximate only; parts of deposit contain higher % gravel.	17	80	3	-	2	7	7	Glacially thrust	Thrust gravel is glaciofluvial (contains igneous clasts).
2	Dirty gravelly sand	56	88	Deposit is shallow, limited in extent and affected by watertable.	35	55	10	-	-	2	8	Glaciofluvial	Meltwater channel deposit.
3	Clean sandy gravel	50	48	Deposit limited in extent and close to watertable.	50	48	2	-	3.5	5	2	Fluvial	Terrace deposit, contains deleterious rock types.
4	Clean sand	48	246	Delineation of deposit approximate; grading and continuity of deposit uncertain.	16	82	2	-	-	2	15	Fluvial	
5	Clean sand	1	20	Discontinuous and shallow; delineation approximate.	5	90	5	-	-	0.5	4.5	Glaciofluvial	Meltwater channel deposit.
6	Clean sand	8	155	Deposit below watertable.	5	94	1	-	-	3	5.5	Glaciofluvial	Coarse and medium-grained sand.
7	Clean sandy gravel	9	59	Contains coarse and very coarse gravel.	60	36	4	-	-	3	5.5	Glaciofluvial	Meltwater channel deposit; contains deleterious rock types.
8	Clean sand	51	272	Deposit contains zones of coarse and very coarse gravel.	15	80	5	-	-	?	8.5	Glaciofluvial	Meltwater channel deposit; contains deleterious rock types.
9	Clean sandy gravel	220	216	Delineation and stratigraphy of deposit uncertain; reserves may be less.	50	49	1	-	1	3	15	Fluvial	Terrace; contains deleterious rock tyoes.
10	Clean sand	-	53,060	Deposit contains fine-grained sand; approx. 40% of area covered by dunes up to 8 m high.	-	97	3	-	-	3	3964	Eolian	Stabilized U-shaped dunes; marsh in interdune zones.
11	Clean sand	-	24,010	Deposit contains fine-grained sand; approx. 30% of area covered by dunes up to 8 m high.	-	97	3	-	-	3	2292	Eolian	Stabilized U-shaped dunes; marsh in interdune zones.
12	Clean sand	-	20,580	Deposit contains fine-grained sand; about 40% of area covered by dunes.	-	97	3	-	-	3	1768	Eolian	Marsh in interdune areas.

Deposit Number — Granular deposits shown on this map may have commercial possibilities. That assumption followed from two criteria used in the mapping process: study of the area considered only granular deposits greater than one metre thick, and covering an area more than one hectare; and it only considered deposits where the mineral-aggregate thickness was greater than the overburden thickness. Although the scale of mapping did not permit investigation of all small deposits, many small deposits containing existing pits are indicated.

Material Description — Sand and gravel has a variety of applications, such as concrete for construction, asphalt concrete, subbase and base course aggregate for roads, gravel and sand for road surfaces, and pit run for fill. Gradation, rock hardness, and binding characteristics, are some of the specific qualities that are considered in aggregate towards determining its end use. This map indicates these, and other, geological qualities of the sand and gravel within each deposit, but does not indicate their potential uses. The terms used in the table are defined in the figure below.

Reserves — The method of calculating in cubic metres the aggregate reserves of deposits took four basic steps. First, the area, in hectares, of each deposit was determined using aerial photographs. Second, geological interpretation, sometimes supported by subsurface information, was assumed in determining the geometry of each deposit; to estimate an overall, average deposit thickness in metres. Third, geological study and limited sample analyses determined the texture (gradation) of sediments in the deposit, and an overall average percentage of gravel and sand. Finally, the volume was calculated as follows: reserve gravel (m^3) = area (ha) × thickness (m) × 10,000 × % gravel; the same formula was used for sand.

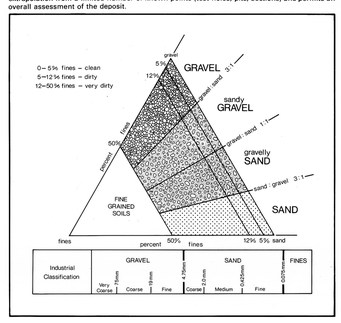
Texture — The texture of the sediment refers to the percentage of particles of various sizes. For mineral aggregate, the most important fractions are the gravel and sand. The actual dimensions of the class and particles in these fractions are given in the figure. The values given for a particular deposit were determined from a field estimate, or from laboratory analysis, of one or more samples from that deposit. Where more than one sample is taken the tabulated number is the mean value.

Wear — The resistance of gravel-size clasts to wear or abrasion can be measured in a laboratory test (ASTM-C131, Los Angeles Abrasion Testing). The amount of material that breaks down into smaller sizes is measured and related to the original sample weight in terms of percent wear. The higher the percentage wear the more susceptible the gravel is to breakdown under stress. Gravel with a percentage wear of less than 40 is considered very resistant.

Overburden Thickness — The thickness of non-economic material, or overburden, covering a deposit, sometimes is a limiting factor in the exploitation of an aggregate deposit. The tabulated values given are approximate overburden thicknesses as determined from geological investigations and subsurface testing.

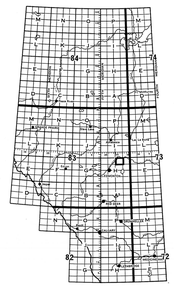
Deposit Area — Deposits in this study were delineated by interpretation of aerial photographs and the contacts should be considered approximate. Information is precise only where test holes, or geological sections, are indicated.

Deposit Genesis — The genesis, or formation, of deposits is vital to the understanding of the gradational nature, extent and geometry of the deposit. This understanding forms the basis for extrapolation from a limited number of known points (test holes, pits, sections) and permits an overall assessment of the deposit.



Map Legend

- 3 Deposit number
- Assumed boundary
- Active or inactive pit
- Alberta Geological Survey test hole
- Sand or gravel exposure
- Buried sand or Gravel deposit



Alberta RESEARCH COUNCIL Natural Resources Division

Alberta Geological Survey

This is a sand and gravel resource map prepared by the Alberta Geological Survey as part of a series at a scale of 1:50,000. The series represents an ongoing aggregate inventory of Alberta which provides data for general land-use planning, land management or aggregate exploration. Please note that the delineation of deposits and calculation of reserves are approximations only.
